

### Red

That you should not go through the line where a red light will and vehicles will stop. or if there was no stopping line, it means that you should not go through it if the signal was in the middle of the road cross on the opposite side If it is a road crossing on the side If it is road crossing on the side It means that you should not enter the road crossing or do not go into the road crossing section of the section where there is a pedestrian crossing

### Red and yellow

Red and yellow lights mean "stop". If the yellow light flashes with the red light, the signal is changed and you should not proceed until the green light appears.

### Green

A green light means vehicles should proceed straight ahead or safely drive left and right. However, if the vehicles are controlled at a road intersection with a green light, the drivers have a traffic jam, if they are in the direction they want to drive and if they enter a road obstacle, it is often implied that the drivers should not be allowed to drive forward because they have not clarified the next opportunity.

### Yellow

If the yellow light is flashing by itself it means vehicles should not cross the "stop" line or you are not from the signal line but too close to the "stop" line or with safety before passing the "stop" signal when the signal light is on. You must not drive through stop signs or line signals.

### Flashing yellow light

A single flashing yellow light means drivers should slow down and drive with caution. Flashing amber lights should be used in the three-color system when there is less traffic and especially at night. Flashed yellow light signals will be deployed at its intended locations, when they are not in operation.
